# Question 1

---

Question Type: MultipleChoice

---

How do multiple Horizon Connection Server instances in a pod maintain synchronization?

## Options:

- A- Horizon Connection Server instances keep their data in an AD LDS database, which is automatically synchronized between the Connection Server.
- B- Horizon Connection Server instances keep their data in an Oracle database, which works as the central hub.
- C- Horizon Connection Server instances keep their data in a local MySQL DB. The data is synchronized once every 24h.
- D- Horizon Connection Server instances keep their data in an MS SQL database, which works as the central hub.

## Answer:

---

A

## Explanation:

Horizon Connection Server instances keep their data in an AD LDS database, which is automatically synchronized between the Connection Server. AD LDS is a Lightweight Directory Access Protocol (LDAP) directory service that provides flexible support for directory-enabled applications, without the dependencies that are required for Active Directory Domain Services (AD DS). AD LDS provides much of the same functionality as AD DS, but it does not require the deployment of domains or domain controllers. In a Horizon environment, each Connection Server instance has a copy of the AD LDS database and replicates changes to other Connection Server instances in the same pod. This ensures that the Connection Server instances have consistent and up-to-date information about the Horizon resources and user sessions.<sup>12</sup>Reference:

# Question 2

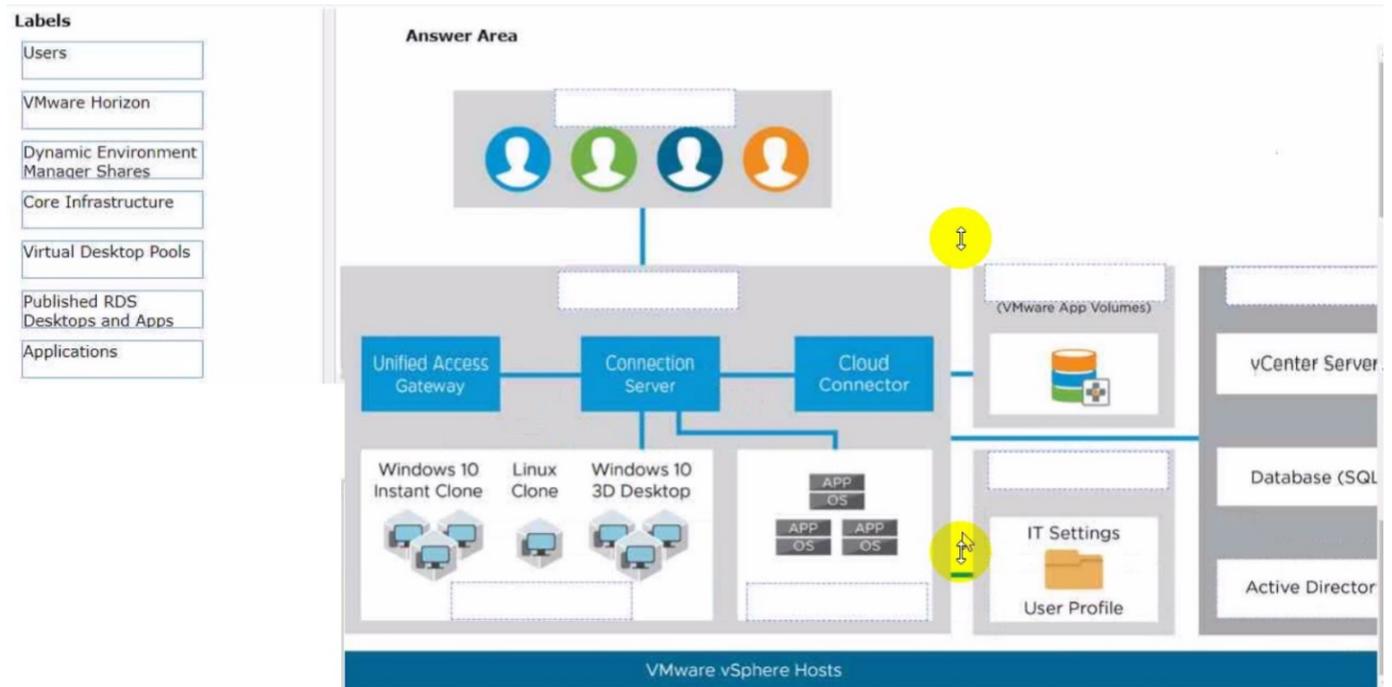

---

Question Type: DragDrop

---

Refer to the exhibit.

Drag and drop the labels on the left into their correct location in the diagram of VMware Horizon Architecture on the right.

**Answer:**

See the Answer in the Premium Version!

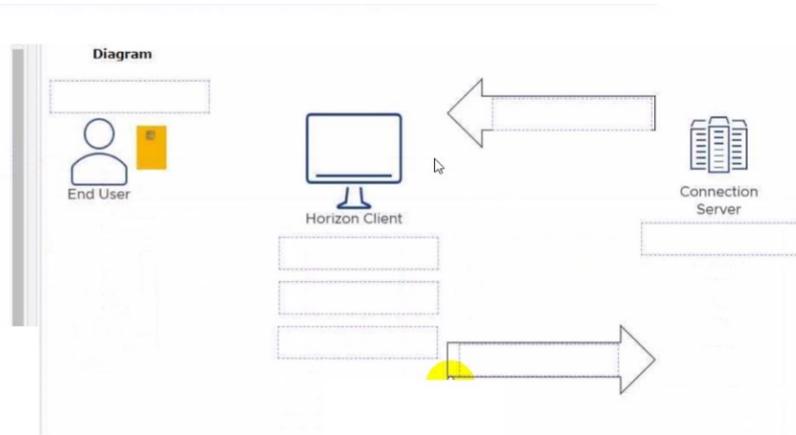

## Question 3

Question Type: DragDrop

Refer to the exhibit.

Drag and drop the labels on the left for the authentication flow for smart cards into the correct location in the diagram on the right.

Labels	
User inserts smart Card.	Server sends a list of certificates.
Verifies the certificate against an available	Selects a suitable certificate.
Prompts user to enter smart card pin.	Client sends user certificate.
Verifies user certificate's trust and validity period.	

**Answer:**

See the Answer in the Premium Version!

## Question 4

**Question Type:** MultipleChoice

An administrator configured a virtual machine to use an NVIDIA card but the virtual machine is not starting up.

What could be the cause of the issue? (Choose two.)

**Options:**

- A- 3D graphics cannot be used with local storage.
- B- The Desktop Pool doesn't support 3D cards.
- C- No suitable host could be found.
- D- Not all memory has been reserved on the VM.
- E- Not all CPU has been reserved on the VM.

**Answer:**

C, D

**Explanation:**

When configuring a virtual machine to use an NVIDIA graphics card, issues such as the VM not starting can occur if there is no suitable host available that meets the requirements for 3D graphics, or if not

all memory required by the 3D graphics card has been reserved for the VM. Ensuring that the host has the necessary 3D graphics capabilities and that the VM is configured with reserved memory can resolve these issues.

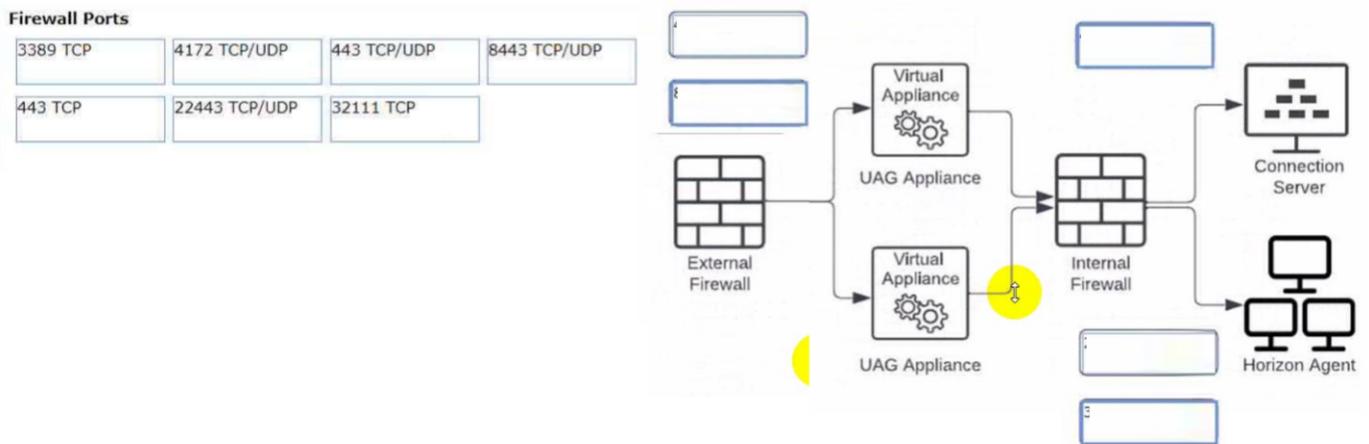

## Question 5

Question Type: DragDrop

Refer to the exhibit.

Drag and drop the appropriate firewall ports in support of the Blast Extreme protocol into the correct locations in the diagram on the right.

Two options will not be used.

**Answer:**

See the Answer in the Premium Version!
