(LIMITED CONTENT)

Question 1

An organization uses a dropdown custom field for the type of creative assets that their internal studio produces. The studio managers use a report grouped by type of asset to determine which assets have been produced by the studio. A decision has been made to concentrate purely on digital work.

which action will prevent the print media options from being selected, while allowing historical data to display on the report?

Options:

A- Hide the print choices on the dropdown field
B- Remove the print choices on the dropdown field
C- Move the print choices to the end of the dropdown list

Answer:

A

Explanation:

In this case, the organization wants to prevent users from selecting print media options for new entries while still displaying historical data in reports. The best way to achieve this is to hide the print choices in the dropdown field. This approach ensures that:

Historical data remains unaffected: Since you are only hiding the options and not removing them, existing records with those print media values will continue to display in reports and other views.

No selection of new print options: By hiding these options, users will no longer be able to select them for new records, effectively preventing any further print media classifications.

Removing the print options (Option B) would delete historical data associated with them, which is not desirable for reporting. Moving them to the end of the list (Option C) doesn't restrict users from selecting them, which does not meet the objective of focusing solely on digital work.

This practice aligns with Adobe Workfront's best practices for managing dropdown fields, where options can be hidden but not removed, thus preserving the integrity of historical data while controlling future input.

For more details, refer to the Custom Fields section in Workfront's documentation, specifically around managing dropdown options and preserving historical data visibility in reports.

Question 2

As part of the configuration of the workfront for Experience Manager enhanced connector, the solutions consultant needs to limit the access of the legal team Specifically, the legal team should only have read access to all of the content in Experience Manager. This group of users will solely be working in Workfront. but will have access to Experience Manager via the enhanced connector. The consultant has created a new user group in Experience Manager that includes the members of the legal team that exist in wf-workfront-users.

How should the solution consultant manage their access?

Options:

A- By adding the legal group to the AEM provided Contributors user group

B- By applying ACEs to the wf-workfront-users user group

C- By adding the legal user group to the AEM provided Everyone user group

Answer:

B

Explanation:

In this case, the solutions consultant needs to limit the legal team's access to read-only for all content in AEM. Since the legal team will be working in Workfront and accessing AEM via the enhanced connector, the best way to manage their access is to apply Access Control Entries (ACEs) to the wf-workfront-users user group.

ACEs allow you to specify detailed permissions for a group or user in AEM, such as granting read-only access to specific resources or folders within the DAM.

Options A and C would either grant too much access (as in the case of the Everyone user group) or allow contributions, which is beyond the requirement of just reading access.

Refer to AEM Access Control Management documentation to learn more about setting up ACEs and managing permissions.

Question 3

Question Type: MultipleChoice

While reviewing the customer's configuration, the consultant lists the following paths as existing within the customer's Experience Manager repository:

/Apps/dam/gui/content/foldermetadatasschemaeditor

/Apps/dam/gui/content/folderscheduleconfiguration

/Apps/dam/gui/content/folderschemaconfigproperties

Which path must be deleted prior to the installation of the Enhanced Connector?

Options:

A- /Apps/dam/gui/content/foldermetadatasschemaeditor

B- /Apps/dam/gui/content/folderscheduleconfiguration

C- /Apps/dam/gui/content/folderschemaconfigproperties

Answer:

A

Explanation:

Before installing the Enhanced Connector, the path /Apps/dam/gui/content/foldermetadatasschemaeditor should be deleted to avoid conflicts with the new configuration. This path relates to the older folder metadata schema editor, which can interfere with the Enhanced Connector setup.

Paths related to folder scheduling (folderscheduleconfiguration) and configuration properties (folderschemaconfigproperties) are not related to the Enhanced Connector and do not need to be removed.

Refer to the Enhanced Connector installation guide for specific details on preparing the AEM repository for the connector.

Question 4

Question Type: MultipleChoice

A company purchases Adobe Workfront with a team plan and no Third-party products. They occasionally need to upload a document related to a task for approval. Users do not need to mark up and comment on the uploaded documents, in addition, electronic validation is not currently a requirement.

which tool should be used to meet this need?

Options:

A- Workfront Proof

B- AdobeSign

C- Document approvals

Answer:

C

Explanation:

Given that the company only occasionally needs to upload documents for approval and does not require advanced features like markup or electronic validation, the Document approvals feature in Workfront is the best choice.

Document approvals allow users to upload documents, assign approvers, and receive approval/rejection responses without the need for advanced proofing or signing functionality.

Options A (Workfront Proof) and B (AdobeSign) provide more advanced capabilities like markup, commenting, and e-signatures, which are unnecessary for this use case.

Refer to Workfront's document management features for more information on basic approval workflows.

Question 5

Question Type: MultipleChoice

On the dispatcher, the consultant is reviewing what HTTP request methods to allow to /bin/workfront-tools. The following methods are available: GET, HEAD, POST, PUT, and DELETE.

Which requests should be allowed?

Options:

A- DELETE POST and GET

B- HEAD. PUT. and DELETE

C- GET, POST, and PUT

Answer:

C

Explanation:

When configuring allowed HTTP request methods for /bin/workfront-tools on the AEM dispatcher, the safest and most appropriate methods to allow are GET, POST, and PUT. These methods cover the basic operations for retrieving data (GET), submitting data (POST), and updating data (PUT), which are typically required for the Enhanced Connector functionality.

GET: Used to retrieve data from the server.

POST: Used to send data to the server.

PUT: Used to update resources on the server.

Options A (DELETE) and B (HEAD, DELETE) are riskier and less commonly needed for this use case, and DELETE should be restricted unless absolutely necessary to prevent unintended deletions.

Refer to Adobe documentation on Dispatcher security for best practices regarding allowed HTTP methods.
